

WFP Kano State Food Security Assessment Report

Executive Summary

This report presents findings from a simulated food security assessment conducted across selected LGAs in Kano State.

Analysis indicates notable disparities in food security levels between urban and rural LGAs. Rural communities exhibit higher vulnerability due to lower household income, larger family sizes, and increased dependence on unstable income sources.

Key Findings

1. Household Vulnerability

Large households with low income show significantly higher hunger severity.

Households with:

- 8+ members
- Income below ₦50,000
- High dependency ratios

showed elevated food insecurity.

2. Hunger Severity

The dashboard classified households into:

- Minimal
- Moderate
- Severe
- Critical

A significant portion of surveyed households fell into Severe and Critical categories.

3. Income Impact

Income strongly influenced food security outcomes.

Households relying on:

- Casual labor
- Small trading
- Farming

were more exposed to hunger shocks.

4. Food Market Inflation

Rice, millet, and maize prices showed upward trends across several LGAs.

Price increases reduced household purchasing power.

5. Geographic Risk

High-risk zones showed:

- lower average FCS
- higher rCSI
- lower income levels

These areas require prioritized intervention.

Recommendations

Immediate Actions

- Expand food assistance in high-risk LGAs
- Prioritize vulnerable households
- Increase market monitoring

Medium-Term Actions

- Strengthen livelihoods
- Improve resilience programming
- Expand cash transfer support

Conclusion

The dashboard demonstrates how analytics can support humanitarian decision-making by transforming raw household data into actionable intelligence.

Data-driven intervention improves efficiency, targeting, and impact.
